

Colocation

Gives businesses control, security, dedicated power, and bandwidth, with an always-on approach for servers. Businesses looking to make the move to Cloud services usually either have internal racks within their office or already have infrastructure hoisted and rented in at least one or more racks in a Data Centre.

Unity's Colocation is the practice of renting space for servers and other computing hardware at a third-party provider's data centre facility. Typically, colocation services include the building in which everything is housed, as well as networking, physical security, redundant power, and redundant cooling components, which then support the servers and storage provided by the customer.

It offers a safe facility that protects high-value data in a secure location. Customers provide the hardware, and we will secure, power, and connect your complete solution through our data centre on to the web or onto private networks.

UCS Colocation centre is a Data Centre where equipment, space and bandwidth are available for rental to customers.

24/7 Support: immediate access to our UK-based 24/7 engineering team.

Extremely secure physical location:

Dedicated Service Management: our dedicated service management team are always on hand to support, working with you to ensure your systems are protected.

Unity Expertise: with over 5 years working with businesses in colocation and Disaster Recovery, we can help.

Service Excellence: our services are underpinned by our unbeatable IT Support Solutions.
